Current Techniques in Small Animal Surgery, Fifth Edition provides current information regarding surgical techniques from the perspective of clinicians who are performing specific procedures on a regular basis. It is intended to be concise, well illustrated, and reflective of the writer's experience, both good and bad. The emphasis with this volume is technique. The pathophysiologic principles and applications are covered in the companion volume, Mechanisms of Disease in Small Animal Surgery, Third Edition. These two books are regarded by most practitioners and students as being a two-volume set. This book contains extended and revised versions of the best papers presented at the 18th IFIP WG 10.5/IEEE International Conference on Very Large Scale Integration, VLSI-SoC 2010, held in Madrid, Spain, in September 2010. The 14 papers included in the book were carefully reviewed and selected from the 52 full papers presented at the conference. The papers cover a wide variety of excellence in VLSI technology and advanced research. They address the current trend toward increasing chip integration and technology process advancements bringing about stimulating new challenges both at the physical and system-design levels, as well as in the test of these systems. With the demands of quality management and process control in an industrial environment machine vision is becoming an important issue. This handbook of machine vision is written by experts from leading companies in this field. It goes through all aspects of image acquisition and image processing. From the viewpoint of the industrial application the authors also elucidate in topics like illumination or camera calibration. Attention is paid to all hardware aspects, starting from lenses and camera systems to camera-computer interfaces. Besides the detailed hardware descriptions the necessary software is discussed with equal profoundness. This includes sections on digital image basics as well as image analysis and image processing. Finally the user is introduced to general aspects of industrial applications of machine vision, such as case studies and strategies for the conception of complete machine vision systems. With this handbook the reader will be enabled not only to understand up to date systems for machine vision but will also be qualified for the planning and evaluation of such technology. This volume presents the proceedings of the CLAIB 2016, held in Bucaramanga, Santander, Colombia, 26, 27 & 28 October 2016. This work is in part a continuation of research performed on positive-grid electron guns. The new effort which has been undertaken at this time is concerned with cathode, electron gun and electron beam problems; and with the development of a system for cycled operation of a camera tube of the image orthicon type. It is also a continuation of work in developing a target structure consistent with the requirements for a high sensitivity camera tube capable of 1500 television lines per inch at 50 percent sine-wave response over a 2 in. x 2 in. format. During this report period nine (9) 4-1/2 in. tubes were built and tested. The work at RCA Harrison was directed towards investigating the resolution obtainable in a 50 x 50 mm target area. (Author). "Since 1888, a series of mutually perpendicular lines have been used as a test object for evaluation of optics, systems, products, etc. The availability of such test objects has traditionally been in the frequency range of about one cycle per millimeter to a couple hundred cycles per millimeter. These have been available from a few manufacturers, none of which offers the extended range of .25 cycles per millimeter to greater than one thousand cycles per millimeter proposed in this project. The usefulness of such an extended range serves to make it an all-purpose test target for measurement of enlarging, contact and reduction systems. Since the test object is on film, it can be used with ease in each of these systems. The actual test object range obtained was from .25 cycles per millimeter to greater than one thousand cycles per millimeter. The camera attained this by a simple but effective three station, multi-exposure method. The advantage of such an exposure method is that optimum independent line width control can be used at each exposure step. Breaking the total frequency range into three groups eases exposure and optical restrictions but does produce mechanical registration problems. It is obvious that with a reasonable budget a sturdier, higher precision and more reproducible instrument could be built such that this extended range resolving power test target could be produced on a production basis."--Abstract. The 6th FTRA International Conference on Computer Science and its Applications (CSA-14) will be held in Guam, USA, Dec. 17 - 19, 2014. Space Law: A Case Study for the Practitioner: Implementing a Telecommunications Satellite Business Concept concentrates on the law governing commercial space ventures, commercial telecommunications satellite projects, in particular. The telecommunications satellite industry is by far the most mature of all the commercial space industries with a commensurate body of law governing it, & many of the same types of regulatory processes & private law transactions discussed in this book also pertain to the implementation of other commercial, & even non-commercial & military space ventures. The reader will find a clear description of the necessary legal actions lawyer & client must take to provide for the construction, launching & operation of a privately-owned telecommunications satellite. Both international & national laws & regulations

pertaining to space projects are discussed. A step-by-step approach to legal actions has been adopted to help make the book a practical, easy-to-use reference tool. It is designed to assist lawyers in private practice, government attorneys, corporate legal counsel, entrepreneurial executives & teachers & students of space law. Space Image Processing covers the design and coding of PC software for processing and manipulating imagery obtained by satellites and other spacecraft. Although the contents relate to several scientific and technological fields, it serves as a programming book, providing readers with essential technical information for developing PC applications. The material focuses on images of the planet and other celestial bodies obtained by orbiting and non-orbiting spacecraft. This book is not about raster graphics in general, but about raster graphics processing as it applies to space imagery. Three parts divide the text: Science - background at an introductory level - scientific principles underlying space imagery and its processing - topics related to space and remote sensing Technology - topics related to space imagery - geodesy, cartography, image data formats, image processing Programming - code examples for DOS and Windows programming on the PC - consideration of low-level and C++ code - routines with a tutorial and demonstrative purpose Space Image Processing includes a CD-ROM holding all the source code and programs discussed in the text. The CD contains a demo version of the TM-Lab program, a public domain Thematic Mapper scene of the Grand Canyon area, two public domain space image viewers, and sample images.

Achieve the Best Camera Design: Up-to-Date Information on MCMs Miniature camera modules (MCMs), such as webcams, have rapidly become ubiquitous in our day-to-day devices, from mobile phones to interactive TV systems. MCMs—or "smart" cameras—can zoom, adjust their frame rate automatically with illumination change, focus at different distances, compensate for hand shake, and transform captured images. With contributions from academics and field engineers, *Smart Mini-Cameras* discusses the structure, operation principles, applications, and future trends of miniature mobile cameras. It compares this technology with traditional digital still cameras and explains the specific requirements of MCM components (imposed by the size or type of application) in terms of optical design, image sensor, and functionalities. The book describes the implementation of several active functionalities, including liquid crystal auto focus (AF) and optical image stabilization (OIS). It also explores how new technologies, such as the curved detector and transforming optics, are stimulating novel trends, including a miniature panoramic lens on mobile phones. By providing you with an understanding of the components and performance tradeoffs of MCMs, this book will help you achieve the best camera design. It also answers frequently asked questions, such as the importance of the number of megapixels in a mobile phone camera and the value of AF and OIS features.

Image orthicons with structured targets were tested using a new cycled test set which separates the functions of exposure and read-out by a selected time interval. Resolution of image orthicons, when cycled in a manner corresponding to slow scan read-out, has exceeded 50 percent sine-wave response at 500 TV lines/inch. Possible means of increasing resolution toward the contract objective of 1500 TV lines/inch are discussed. Electron gun resolution, measured at high velocity, was nearly doubled during the year. Improvement was achieved by smoothing the mixed carbonate cathode coating. The procedures used to process targets are explained in detail. (Author). Several Python programming books feature tools designed for experimental psychologists. What sets this book apart is its focus on eye-tracking. Eye-tracking is a widely used research technique in psychology and neuroscience labs. Research grade eye-trackers are typically faster, more accurate, and of course, more expensive than the ones seen in consumer goods or usability labs. Not surprisingly, a successful eye-tracking study usually requires sophisticated computer programming. Easy syntax and flexibility make Python a perfect choice for this task, especially for psychology researchers with little or no computer programming experience. This book offers detailed coverage of the Pylink library, a Python interface for the gold standard EyeLink ® eye-trackers, with many step-by-step example scripts. This book is a useful reference for eye-tracking researchers, but you can also use it as a textbook for graduate-level programming courses. Nearly all major planets and moons in our Solar System have been visited by spacecraft and the data they have returned has revealed the incredible diversity of planetary surfaces. Featuring a wealth of images, this textbook explores the geological evolution of the planets and moons. Introductory chapters discuss how information gathered from spacecraft is used to unravel the geological complexities of our Solar System. Subsequent chapters focus on current understandings of planetary systems. The textbook shows how planetary images and remote sensing data are analyzed through the application of fundamental geological principles. It draws on results from spacecraft sent throughout the Solar System by NASA and other space agencies. Aimed at undergraduate students in planetary geology, geoscience, astronomy and solar system science, it highlights the differences and similarities of the surfaces at a level that can be readily understood by non-specialists. At the dawn of the new millennium, robotics is undergoing a major transformation in scope and dimension. From a largely dominant industrial focus, robotics is rapidly expanding into the challenges of unstructured environments. Interacting with, assisting, serving, and exploring with humans, the emerging robots will increasingly touch people and their lives. The goal of this new series of Springer Tracts in Advanced Robotics is to bring, in a timely fashion, the latest advances and developments in robotics on the basis of their significance and quality. It is our hope that the greater dissemination of research developments will stimulate more exchanges and collaborations among the research community and contribute to further advancement of this rapidly growing field. As one of robotics pioneering symposia, ISRR, the "International Symposium on Robotics Research," has established over the past two decades some of the field's most fundamental and lasting contributions. With the launching of STAR, this and other thematic symposia devoted to excellence in robotics and an important

platform for closer links and extended reach within the research community. The Tenth edition of "Robotics Research" edited by Raymond Jarvis and Alex Zelinsky offers its 11-part volume a collection of a broad range of topics in robotics. The content of these contributions provides a wide coverage of the current state of robotics research: the advances and challenges in its theoretical foundation and technology basis, and the developments in its traditional and new areas of applications. Following the highly successful International Conference on Computer Vision - stems held in Las Palmas, Spain (ICVS'99), this second International Workshop on Computer Vision Systems, ICVS 2001 was held as an associated workshop of the International Conference on Computer Vision in Vancouver, Canada. The organization of ICVS'99 and ICVS 2001 was motivated by the fact that the majority of computer vision conferences focus on component technologies. However, Computer Vision has reached a level of maturity that allows us not only to perform research on individual methods and system components but also to build fully integrated computer vision systems of significant complexity. This opens a number of new problems related to system architecture, methods for system synthesis and verification, active vision systems, control of perception and attention, knowledge and system representation, context modeling, cue integration, etc. By focusing on methods and concepts for the construction of fully integrated vision systems, ICVS aims to bring together researchers interested in computer vision systems. Similar to the previous event in Las Palmas, ICVS 2001 was organized as a single-track workshop consisting of high-quality, previously unpublished papers on new and original research on computer vision systems. All contributions were presented orally. A total of 32 papers were submitted and reviewed thoroughly by program committee members. Twenty of them have been selected for presentation. We would like to thank all members of the organizing and program committee for their help in putting together a high-quality workshop. Hair modeling based on real-life capturing is a rising and challenging topic in the field of human modeling and animation. Typical automatic hair capture methods use several 2D images to reconstruct 3D hair model. Most of them usually adopt 3D polygons to present hair strands, and a few recent strand-based methods require heavy hardware settings. We introduce an approach to capture real hair using affordable and common devices such as a depth sensor and a camera to reconstruct a 3D hair model based on particle system. Kinect™ sensor from Microsoft is chosen to capture 3D depth data. However, as Kinect 3D depth data are known to be noisy and 2D texture image to be of low quality, an additional DSLR camera is employed in the system in order to capture high resolution image for hair strand extraction. The proposed approach registers the 3D hair point cloud and high resolution image in the same space, extracts the hair strands manually from the image, and then generates 3D hair strands based on Kinect depth information. Eventually, a particle based 3D hair model is reconstructed. The proposed method captures 360-degree views by collecting datasets of real-life hair with four sets of Kinect sensors and DSLR cameras in four viewpoints. We register the DSLR camera image in the space of Kinect to build the mapping relationship between 2D and 3D. Therefore, the image from

the DSLR camera can be mapped on the point cloud replacing the existing Kinect texture image, resulting in a new high-quality texture image of the 3D data. Next we manually select the hair strands in the high resolution image and we use control points to represent hair strand as a spline curve. These 2D control points are then projected on the 3D point cloud in order to obtain the corresponding 3D information. In 2D image, some hair strands are partially occluded by some other hair strands, the result is that the occluded hair strand is separated into two segments in 3D. An algorithm is applied to analyze and build the connection between the hair strand segments. Meanwhile some refinement works are done with the 3D hair strands, filtering and interpolation techniques are utilized on the 3D hair strand splines to generate smoother 3D hair strands. Finally we reconstruct the 3D hair model, where the strands are represented in the particle system. Our method, combining a depth sensor and an high resolution camera, is novel and has many advantages which other approaches do not have; (i) hardware setting is simple and affordable; (ii) combination of high-quality image of DSLR and depth of Kinect takes advantage of each of them; (iii) the 2D and 3D combined method allows us to repair and refine the 3D data; (iv) Spline-based hair representation can be used to construct a hair particle system which has many advantages of hair animation and simulation.
