Albert Robins Company, Inc. -- Trade Receivables Dec 16 2019 This case raises the question, How does a company reasonably estimate and record entries for uncollectible trade receivables and under what circumstances are receivables written off as uncollectible? The required accounting transactions for the case involve estimating a receivables allowance both as a percentage of sales and as a percentage of accounts receivable, and making specific account judgments under the direct write-off method. The subjective issues involve analyzing and assessing a company's methods of collection and accounting for bad debts.

The New Controller Guidebook Sep 05 2021 The accountant needs to be competent in many areas in order to be an effective controller - the person responsible for all accounting operations. The New Controller Guidebook covers every aspect of being a controller, including the management of accounts payable, cash, credit, collections, inventory, payroll, and more. The book also shows you how to close the books, which reports to issue to the management team, how to create a budget, and how to select and install an accounting computer system. In short, this book provides the accountant with the most essential information needed to be a successful controller.

Do Initial Public Offering Firms Manage Accruals? Evidence from Individual Accounts May 21 2020 We examine whether initial public offering (IPO) firms exercise discretion over an individual accrual account on the balance sheet - the allowance for uncollectible accounts - and an individual accrual account on the income statement - bad debt expense. Our research design exploits a unique disclosure requirement related to these accounts (i.e., the ex post disclosure of write-offs of uncollectible accounts), which enables us to develop refined expectation models. We provide evidence that IPO firms have conservative, not aggressive, allowances in the annual periods adjacent to their stock offerings. In fact, the average IPO firm has an allowance that is over four-times leading write-offs. We also provide evidence that IPO firms record larger, not smaller, bad debt expense and are less likely to record income-increasing bad debt expense than matched non-IPO firms. These results challenge the view that IPO firms understate receivables-related accrual accounts.

A Neural Network Approach to Estimating the Allowance for Bad Debt Oct 06 2021

The granting of credit is a necessary risk of doing business. If companies only accepted cash, sales would be negatively impacted. In a perfect world, all consumers would pay their bills when they become due. However, the fact is that some consumers do default on debt. Companies are willing to accept default risk because the value of defaults does not exceed the value of the additional sales generated. This creates an issue in regards to the valuation of uncollectible accounts. In order for a company to disclose the true value of its accounts receivable, it must establish an allowance for bad debt. Traditionally, companies estimate their bad debt expense and the related allowance for doubtful account by one of two methods: 1) As a percentage of total credit sales or 2) An aging of accounts receivable

(that assesses a higher likely rate of default, the older the account becomes past due). By their very nature, these methods take into account only endogenous variables based on past experiences. For many years, the aforementioned methods of estimating bad debt were the only viable ways of determining the allowance for bad debts. However, with the explosion of technology and the easy availability of information, a more comprehensive method of determining bad debts seems appropriate. Neural network computer systems, which mimic some of the characteristics of the human brain, have been developed and may offer an alternative method for estimating the allowance for bad debt. These systems can predict what events may happen, analyze what did happen, and adjust the factor weights accordingly for the next set of event predictions. Thus, it is noteworthy to explore the use of neural networks to predict what a reasonable allowance for bad debt should be for an entity based on an array of interacting variables. Since, a neural network can incorporate both endogenous and exogenous variables one would expect to use such a system to develop a tool which gives a better estimation of the allowance for bad debt than the traditional approaches. In the current study, the findings indicate that neural networks over the balance of the time are better predictors of a company's ending allowance for bad debt than regression. On a case by case basis, even when neural networks provide a less accurate estimate than regression, statistical analyses demonstrated the neural networks are a less volatile method and their predictions are less likely to result in a significant difference from actual allowance. Neither approach provides results that are exactly the same as the actual ending balance of the allowance for bad debt amount. Even though regression provides a more accurate estimate 45 percent of the time, this result is mitigated by two items: 1) On average, the absolute difference between actual and predicted is much lower when neural networks are used and 2) The standard deviation derived when using neural networks is only a third of the standard deviation derived from regression when applied to the absolute differences between the actual and predicted allowance.

The Allowance for Uncollectible Accounts, Conservatism, and Earnings Management Feb 22 2023 We study the interrelation between conservatism and earnings management by examining the allowance for uncollectible accounts and its income statement counterpart, bad debt expense. We find that the allowance is conservative and that it has become more conservative over time. Conservatism may, however, facilitate earnings management. We find that firms manage bad debt expense downward (and even record income-increasing bad debt expense) to meet or beat analysts' earnings forecasts and that conservatism accentuates the extent to which firms manage bad debt expense. Further, we find that firms manage bad debt expense downward by drawing down previously recorded over-accruals of bad debt expense that have accumulated on the balance sheet. An implication of our study is that tighter limits on the amount by which firms are permitted to understate net assets may reduce their ability to manage earnings.
