Reprint of the original, first published in 1867. Reprint of the original, first published in 1861. In the period since the end of world War II numerous developing countries have employed colonization, or planned pioneer settlement, as one method of building a more reliable and balanced economy. It is felt that the traditional, single-sided systems of farm ownership and production with their latifundium and minifundium holdings will gradually and peacefully become less prominent as better settlement systems are introduced and extended. Marked increases in population pressure, large tracts of unused or underused land, and modern improvements in settlement planning are among other compelling reasons for starting colonization programs. Of all the areas in the world, the continent of South America probably has the widest variety of planned pioneer settlements as well as the most sizeable programs. Brazil, the largest country on the continent, is actively engaged in populating the vast, empty spaces of its interior, and provides excellent opportunities for the scholarly investigation of new frontier settlement types. In addition to the academic discussion of the origin and development of these expressions of man's expansion into marginal areas, the critical examination of relatively new attempts at land settlement is a useful thing because what is to be learned from such studies may be directly applicable to other pioneer zones and, moreover, may be of vital significance to overall economic improvement on the continent. In this monograph, my student, K. Muller, analyzes the South Brazilian frontier colony of Toledo, Parana, founded in 1946. For Stirling engines to enjoy widespread application and acceptance, not only must the fundamental operation of such engines be widely understood, but the requisite analytic tools for the stimulation, design, evaluation and optimization of Stirling engine hardware must be readily available. The purpose of this design manual is to provide an introduction to Stirling cycle heat engines, to organize and identify the available Stirling engine literature, and to identify, organize, evaluate and, in so far as possible, compare non-proprietary Stirling engine design methodologies. This report was originally prepared for the National Aeronautics and Space Administration and the U. S. Department of Energy. This publication presents cleaning and etching solutions, their applications, and results on inorganic materials. It is a comprehensive collection of etching and cleaning solutions in a single source. Chemical formulas are presented in one of three standard formats - general, electrolytic or ionized gas formats - to insure inclusion of all necessary operational data as shown in references that accompany each numbered formula. The book describes other applications of specific solutions, including their use on other metals or metallic compounds. Physical properties, association of natural and man-made minerals, and materials are shown in relationship to crystal structure, special processing techniques and solid state devices and assemblies fabricated. This publication also presents a number of organic materials which are widely used in handling and general processing...waxes, plastics, and lacquers for example. It is useful to individuals involved in study, development, and processing of metals and metallic compounds. It is invaluable for readers from the college level to industrial R & D and full-scale device fabrication, testing and sales. Scientific disciplines, work areas and individuals with great interest include: chemistry, physics, metallurgy, geology, solid state, ceramic and glass, research libraries, individuals dealing with chemical processing of inorganic materials, societies and schools. Written by an experienced professional, this book introduces chemists to process development, using examples from the pharmaceutical, agrochemical and fragrance industries. The focus is on small molecules rather than biomolecules, and on relatively small-scale production rather than bulk petrochemicals. The coverage is broad, going from initial route development, through pilot plant operations, to full-scale production.
